

Enzyme Amperometric Sensors – Glucose and Lactate

Zimmer & Peacock

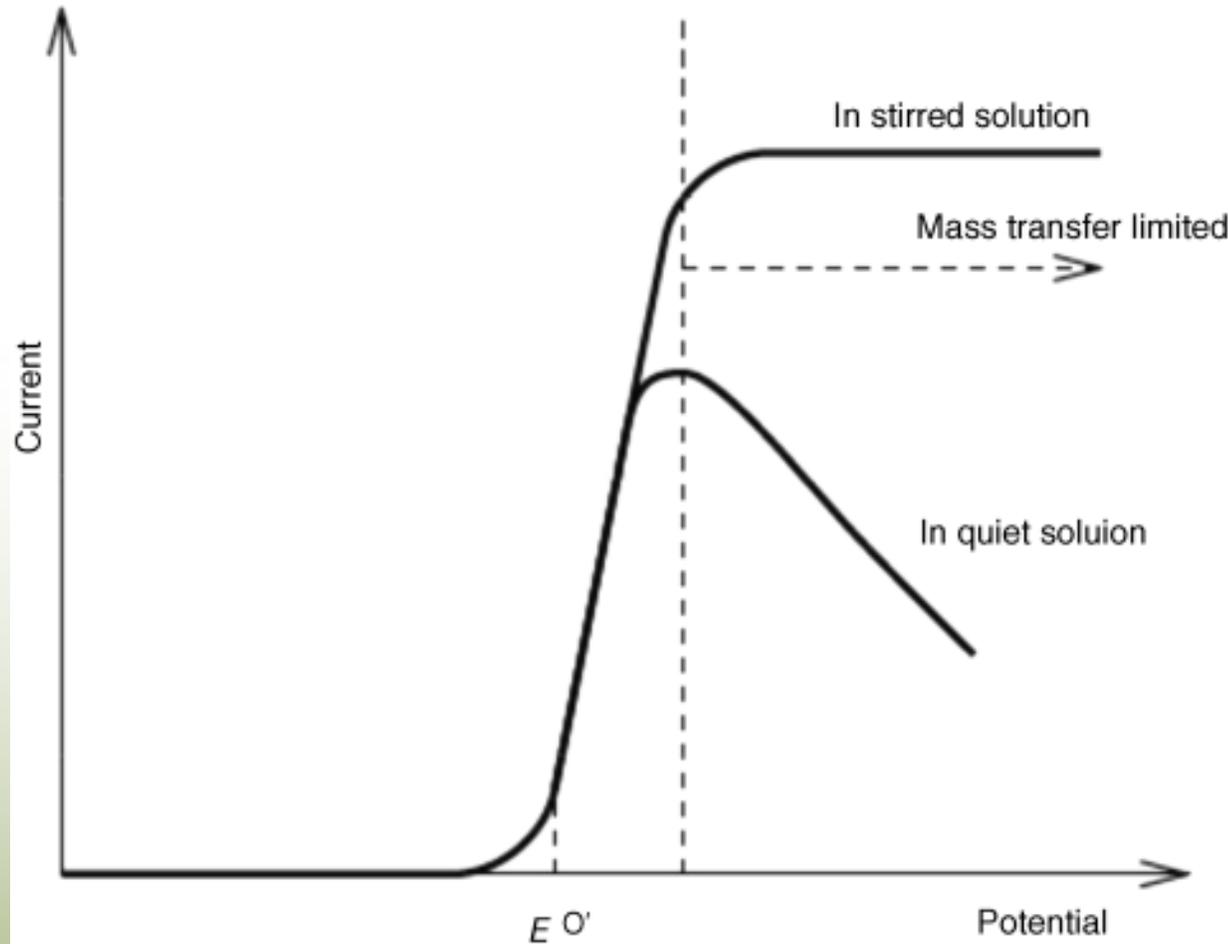

Sensor Manufacturing and Technology

Zimmer & Peacock

eSensor Manufacturing and Technology

Glucose

Amperometric Glucose Sensor

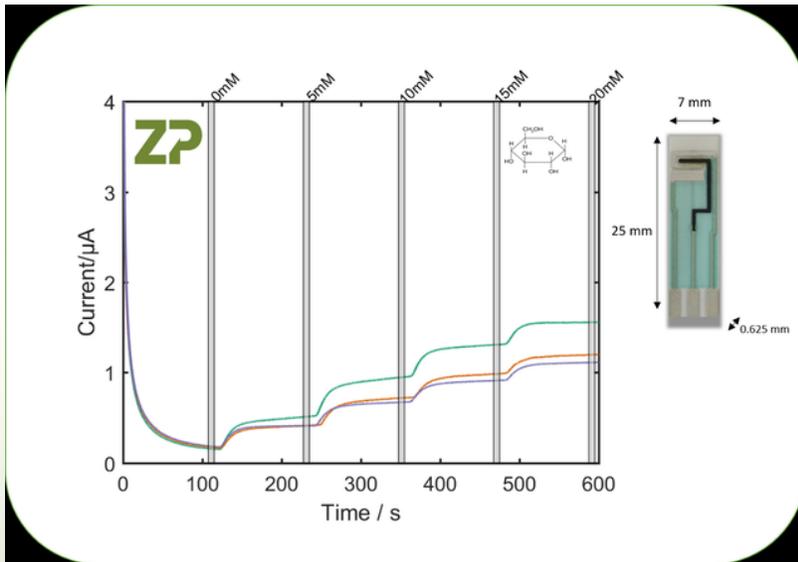

$$i_L/A = k_L n F c^\infty$$

$$i = - \frac{n F A D^{1/2} C}{\pi^{1/2} t^{1/2}}$$

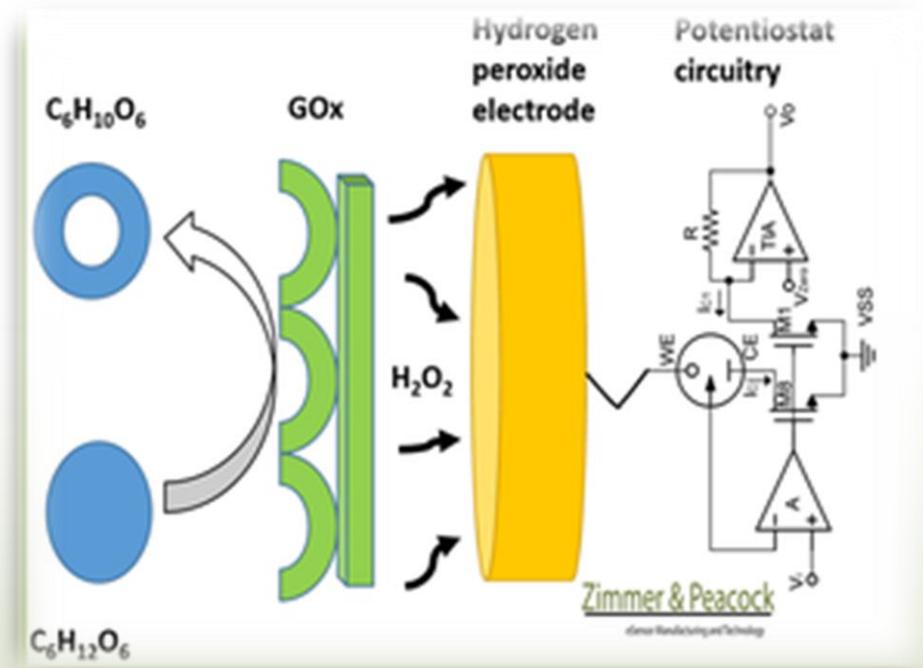

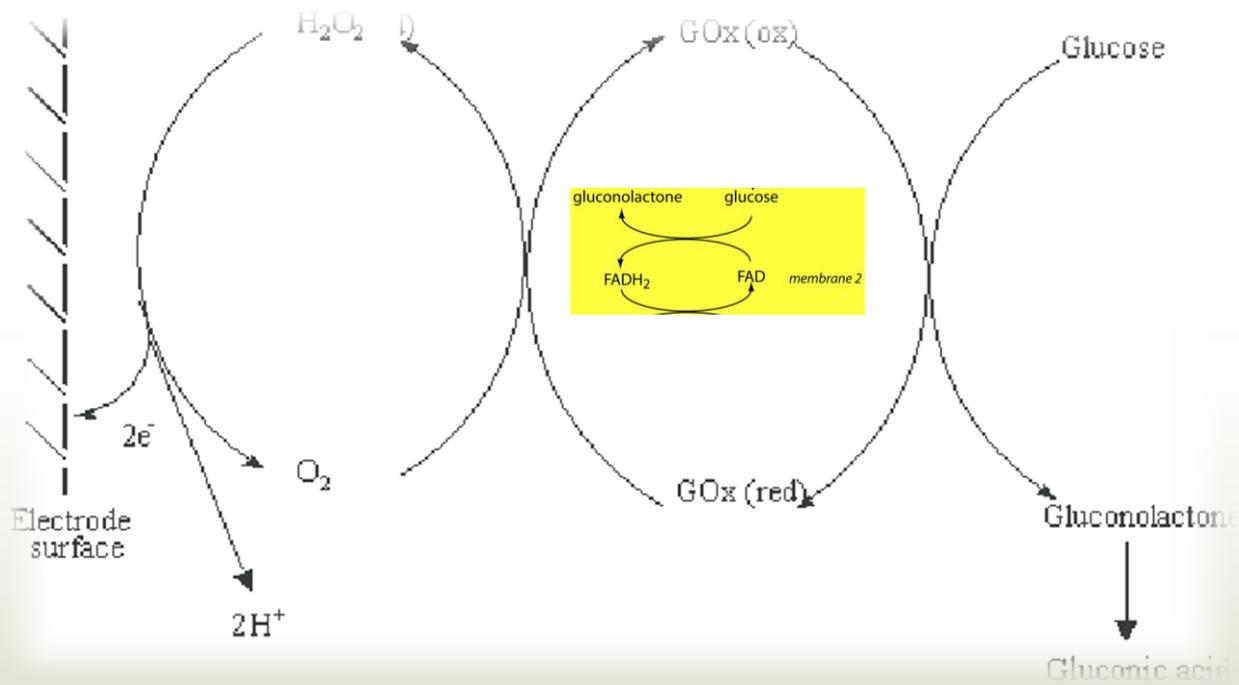

where D = diffusion coefficient
 C = concentration of O in the bulk solution
 A = electrode area

Electrochemical detection of glucose

- Description

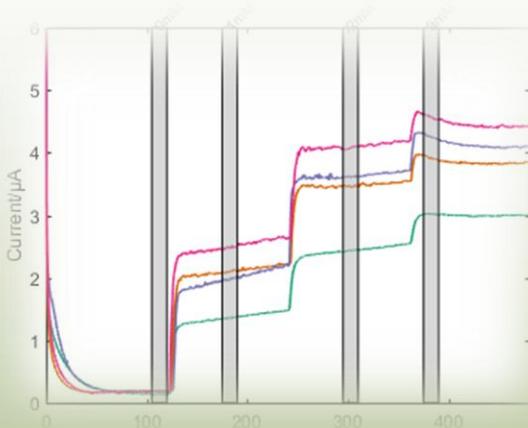

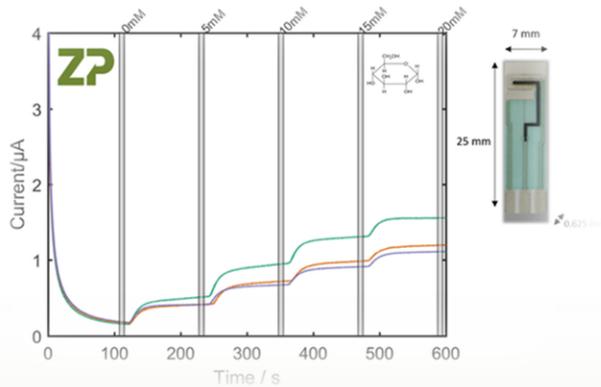

How is the type one glucose sensor working

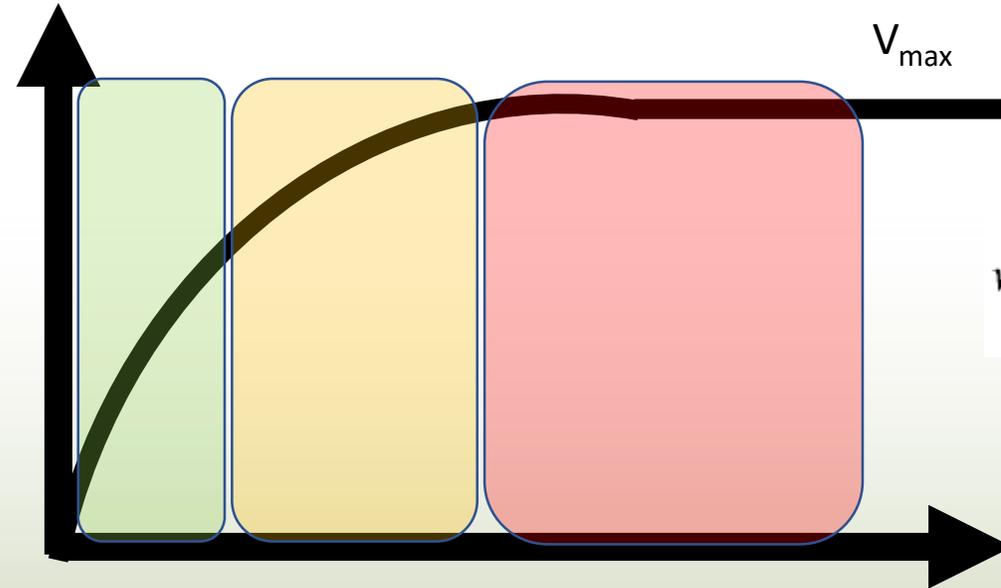

← Direction of electron flow

Michaelis Menten - Enzyme kinetics and rates of reaction

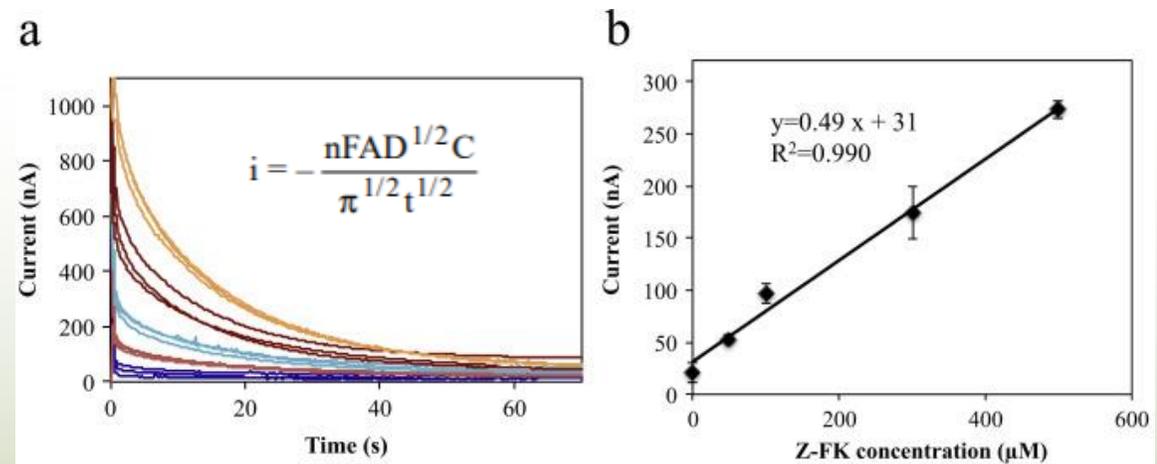

Rate of reaction

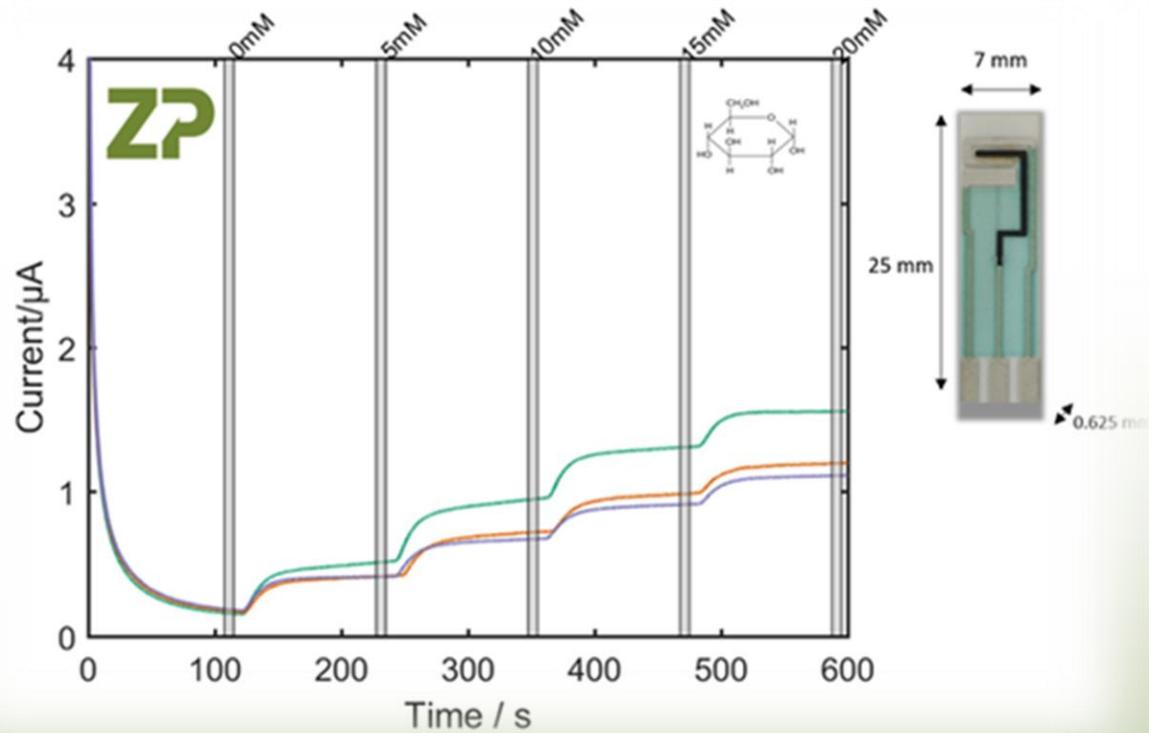

$$v = \frac{V_{\max} [S]}{K_M + [S]}$$

Concentration of substrate

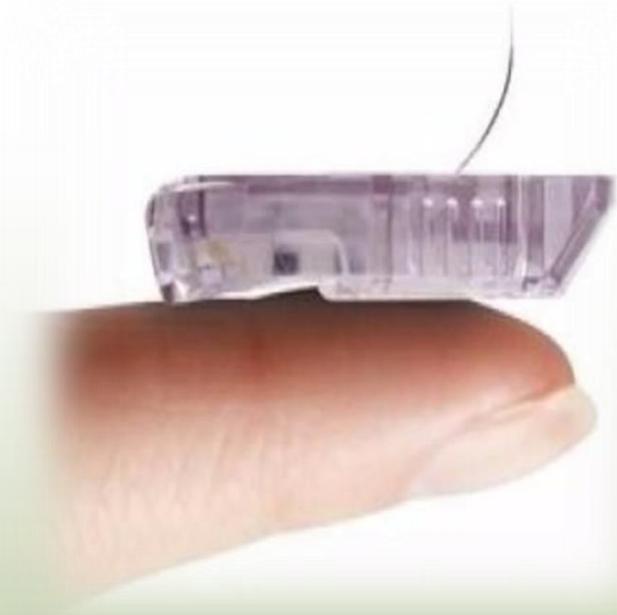

Diffusion controlled – Cottrell current– Ficks 2nd law of diffusion

Mass transport controlled

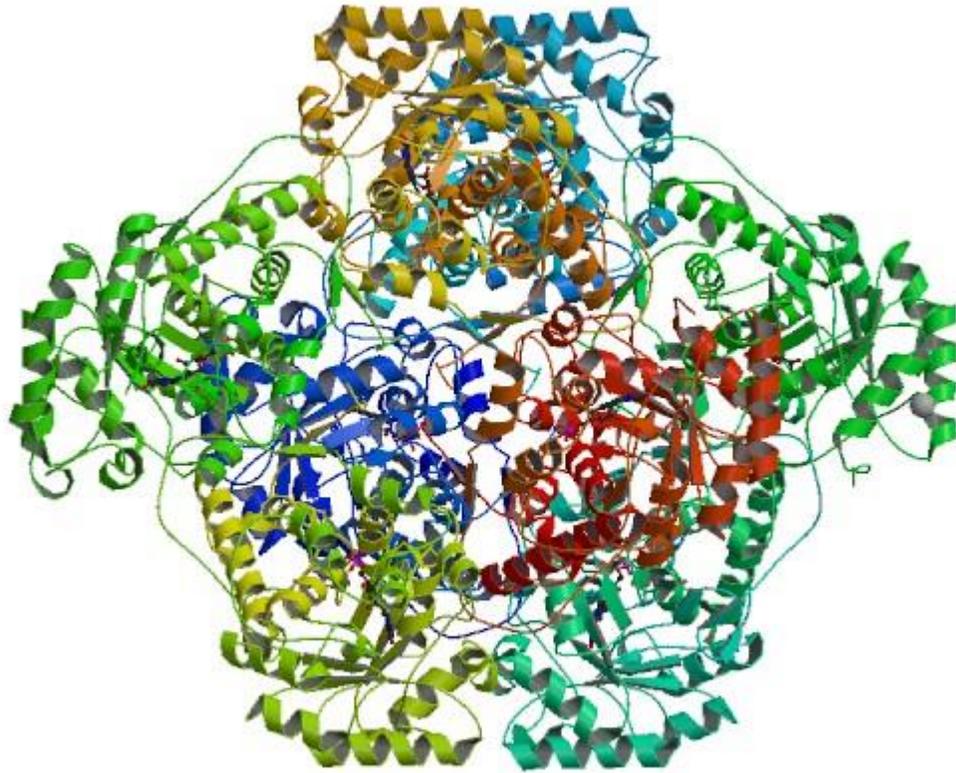

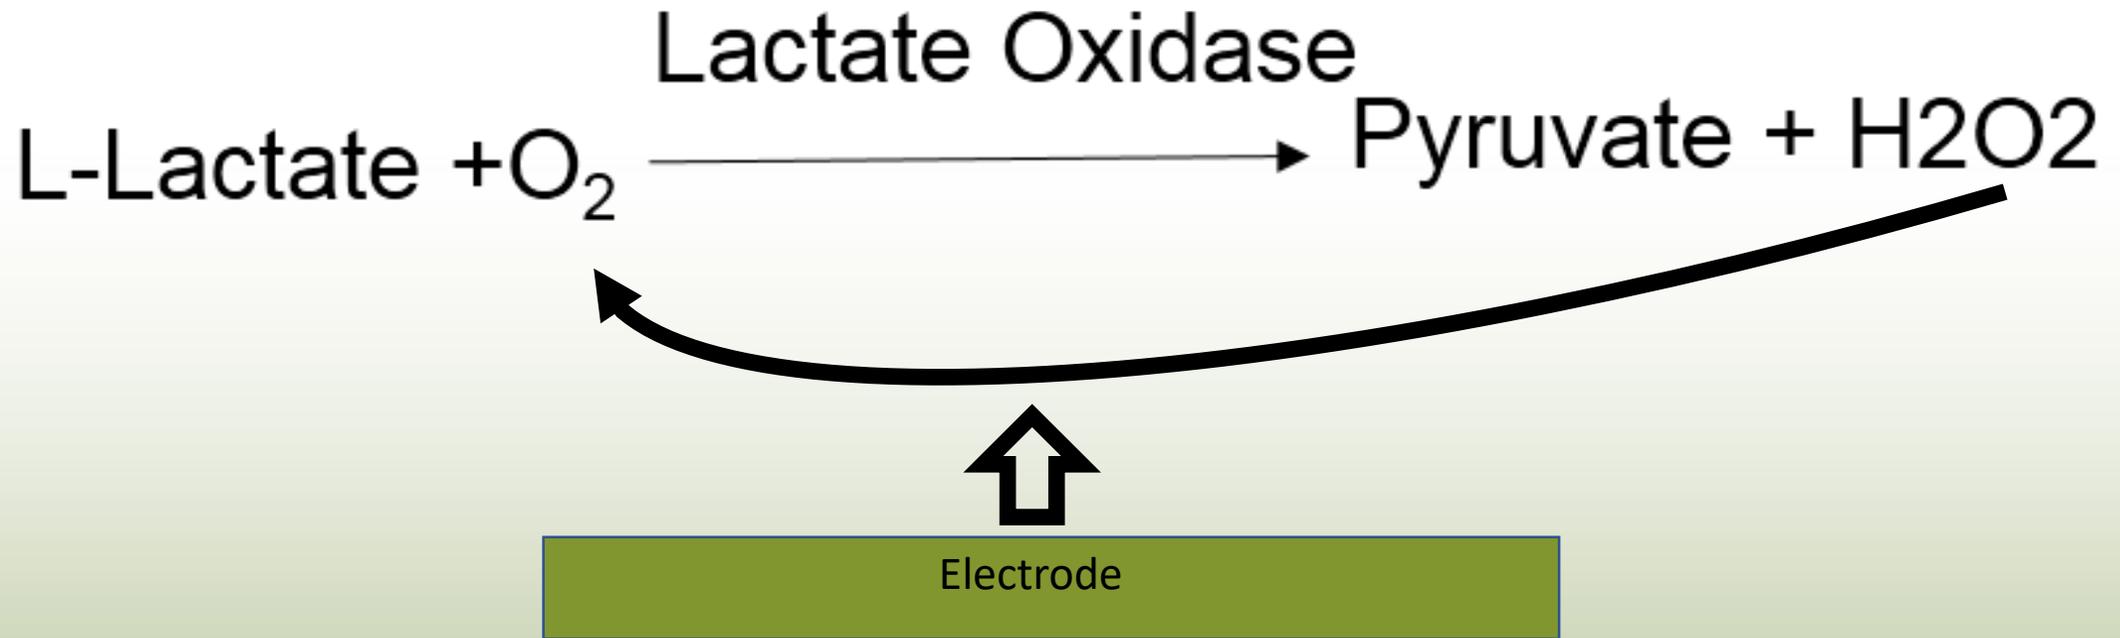

$$i_L/A = k_L n F c^\infty$$

Lactate

Lactate Oxidase

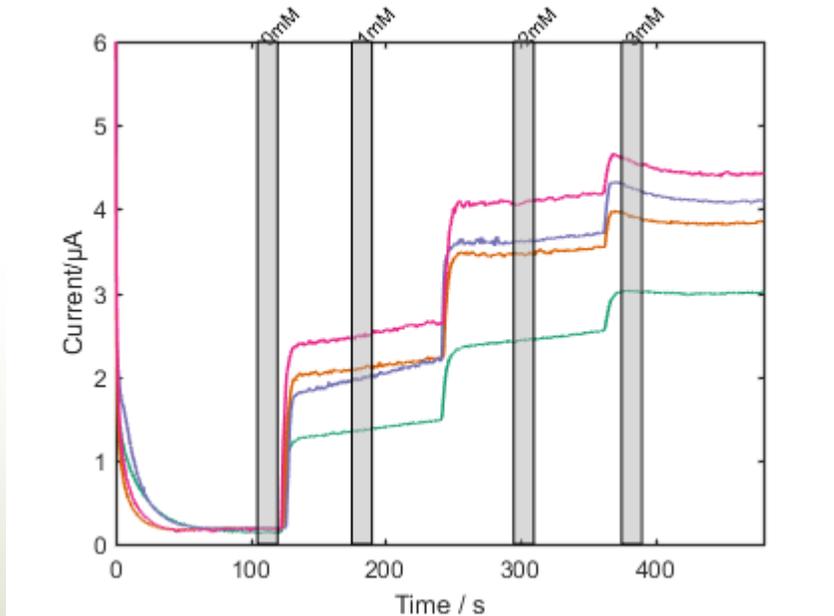

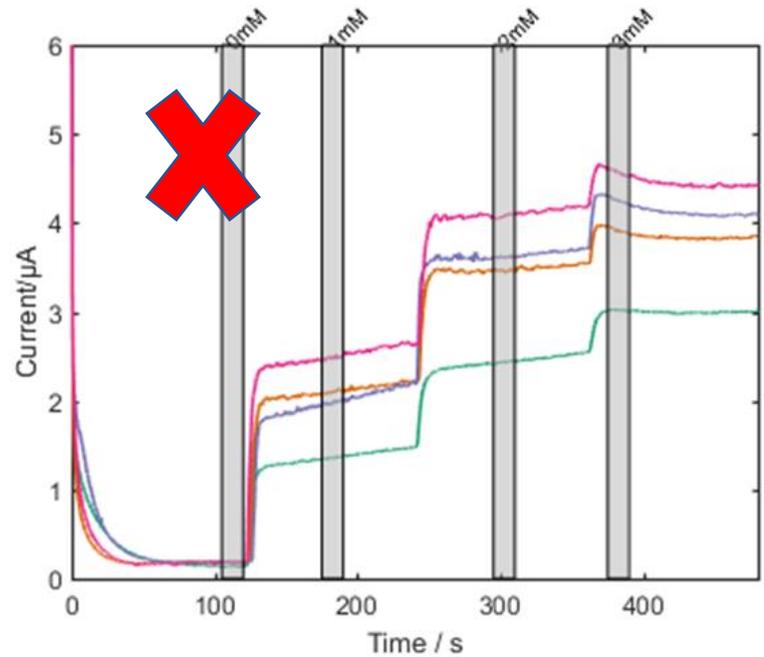

Electrochemical detection of glucose

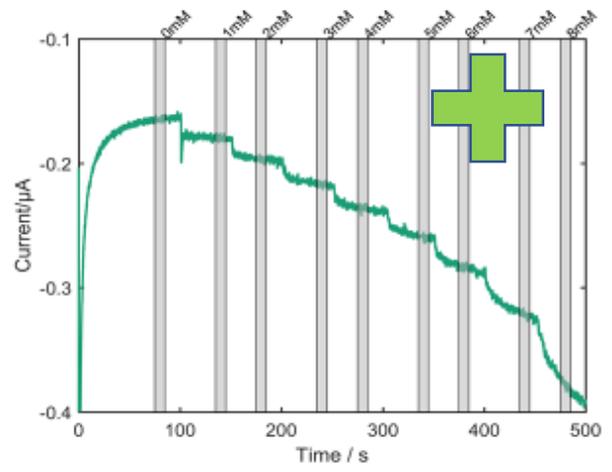

- Description

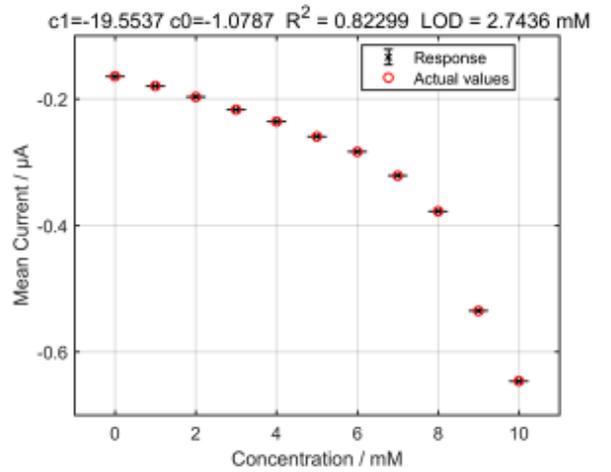

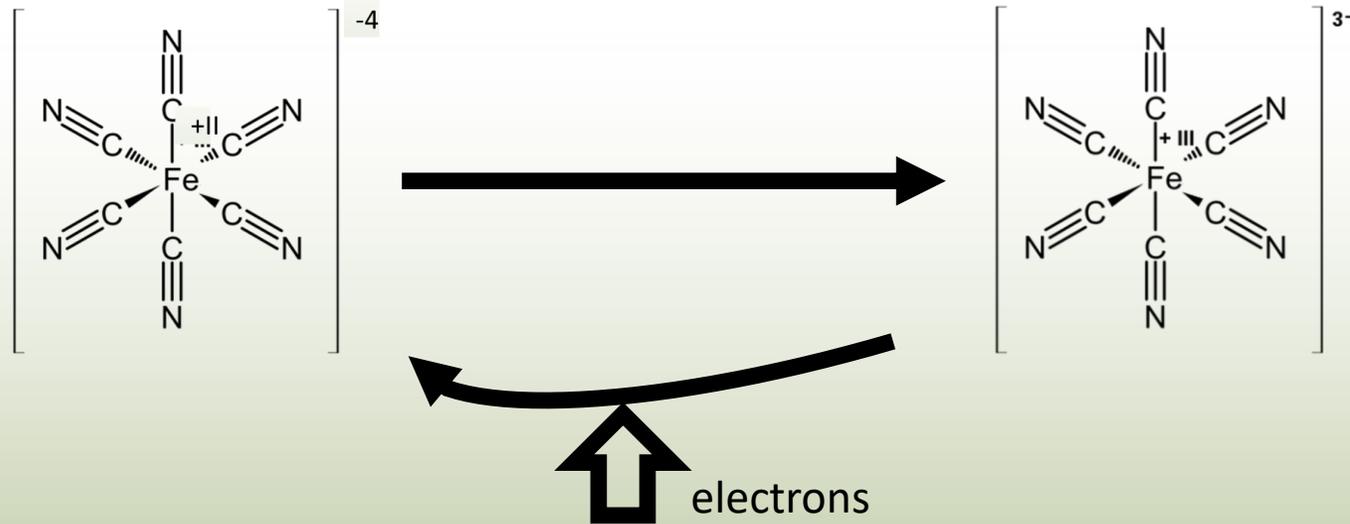

Type 1 Lactate Sensor

Type 2 Lactate Sensor

Type 2 Lactate Sensor

Electrode

Time for practical

- ONE – record a cyclic voltammogram of a glucose sensor without glucose present.
- TWO – record a cyclic voltammogram of a glucose sensor with glucose present.
- THREE - compare the two experiments and chose the lowest voltage where you think the signal is invariant with voltage.
- FOUR – From THREE above run a series of amperometric experiment at that voltage, with increasing amounts of glucose and see what happens as you go from solution to solution.
- Record the current at 5 seconds and plot current versus concentration.
